Alternatives in regular expressions should be grouped when used with anchors	Bug
Array values should not be replaced unconditionally	Bug
Exceptions should not be created without being thrown	Bug
Array or Countable object count comparisons should make sense	Bug
All branches in a conditional structure should not have exactly the same implementation	Bug
The output of functions that don't return anything should not be used	Bug
Unary prefix operators should not be repeated	Bug
"=+" should not be used instead of "+="	Bug
A "for" loop update clause should move the counter in the right direction	Bug
Return values from functions without side effects should not be ignored	Bug
Values should not be uselessly incremented	Bug
Related "if/else if" statements and "cases" in a "switch" should not have	

References used in "foreach" loops should be "unset"

Analyze your code

Bug

Critical

pitfall

When a reference is used in a `foreach` loop instead of using a simple variable, the reference remains assigned and keeps its "value" which is a reference, even after the `foreach` execution. Most of the time, this is not what the developer is expecting and the reference may be used wrongly in the rest of the code. For this reason, it is recommended to always `unset` a reference that is used in a `foreach` to avoid any unexpected side effects.

Noncompliant Code Example

```
$arr = array(1, 2, 3);
foreach ($arr as &$value) { // Noncompliant; $value is still
    $value = $value * 2;
}
$value = 'x';
```

Compliant Solution

```
$arr = array(1, 2, 3);
foreach ($arr as &$value) { // Compliant; there is no risk t
    $value = $value * 2;
}
unset($value);
$value = 'x';
```

the same condition

 Bug

Objects should not be created to be dropped immediately without being used

 Bug

Identical expressions should not be used on both sides of a binary operator

 Bug

All code should be reachable
